

Features documentation

Weather

This feature enables you to offer a weather widget in your app to display the forecasts for a particular city or to the users find the ones for their locations.

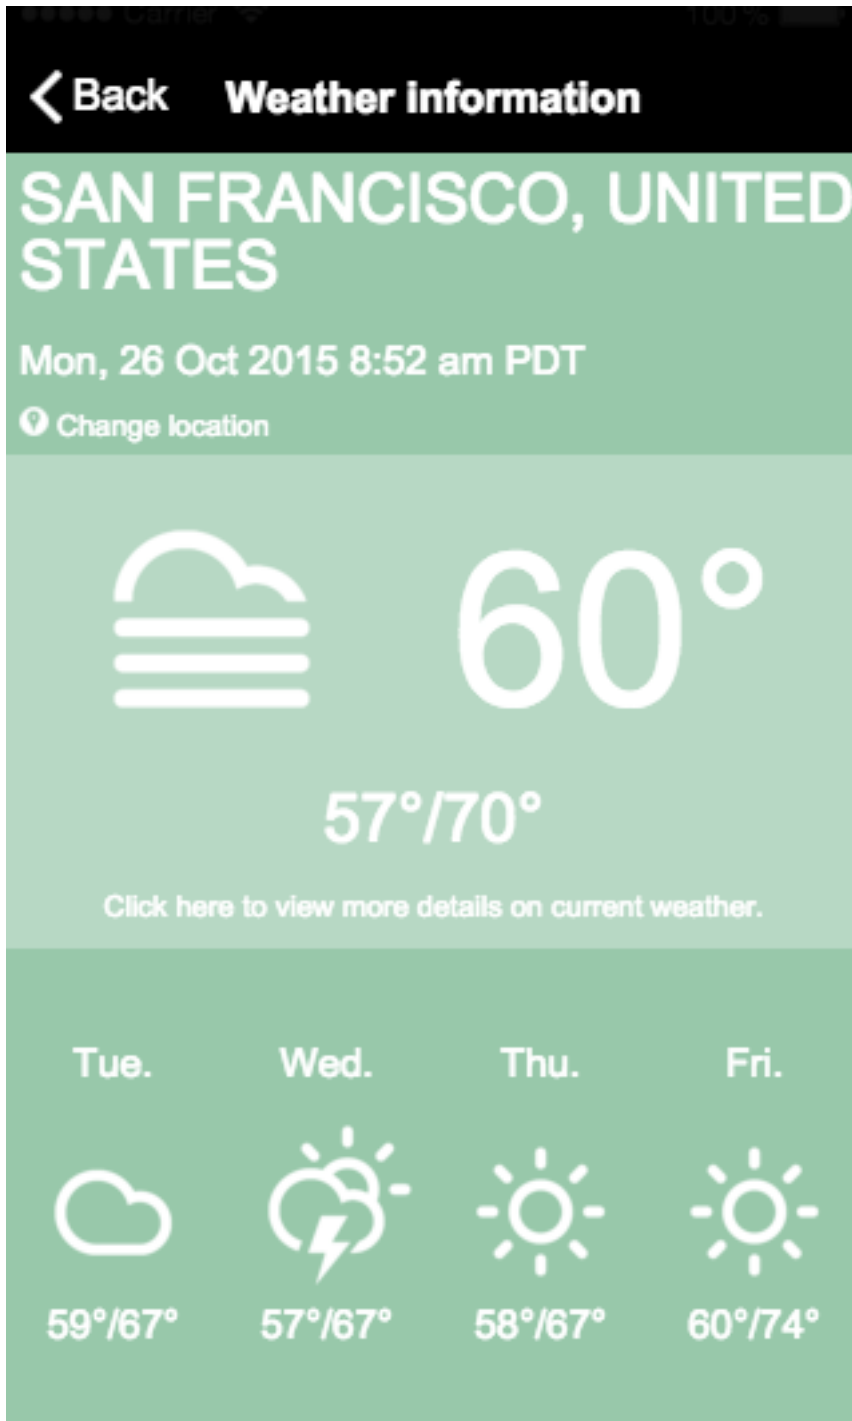

You just have to choose a country and a city, then save.

The screenshot shows a settings page titled "FEATURE SETTINGS". At the top left is a blue button with a white cloud icon. To its right, the "Page name:" is set to "Weather" in a text input field. Further right, the "Activated" status is shown as a blue toggle switch that is currently turned on. Below this section is a "WEATHER INFORMATION" section with three dropdown menus: "Country:" set to "United States", "Postal code or city:" set to "San Francisco", and "Units:" set to "°F, mph, mi". A blue "Save" button is located at the bottom right of the settings area.

This is how it looks like in your app:
